

# Instructions for configuring IP Dynamically

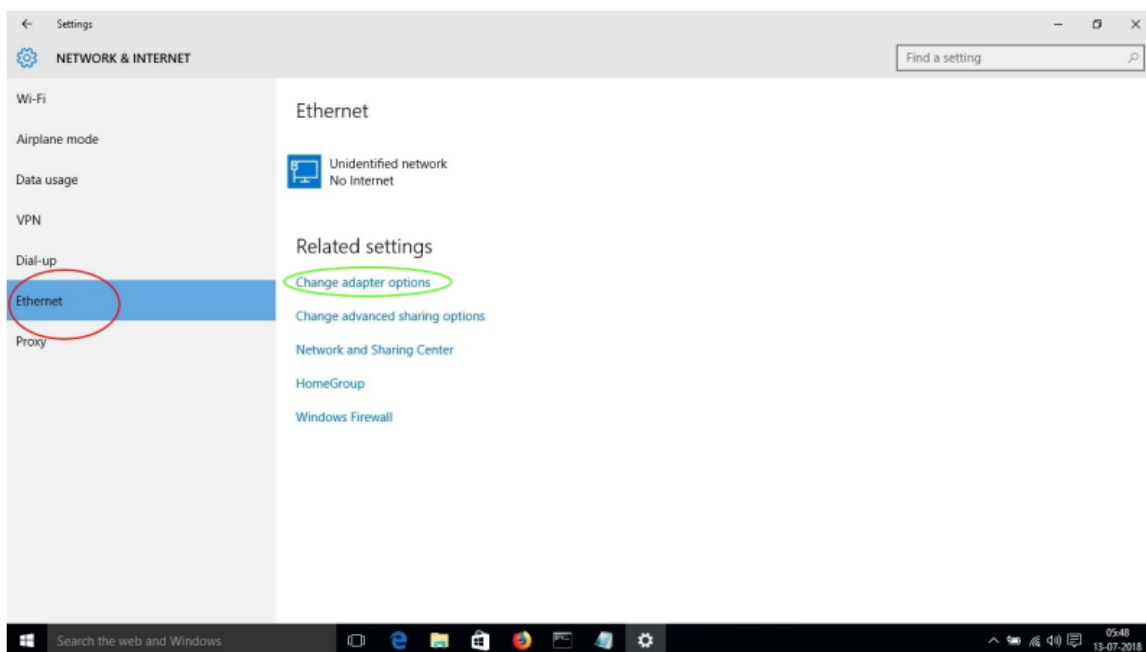

---

## Setting the IP(Windows 10)

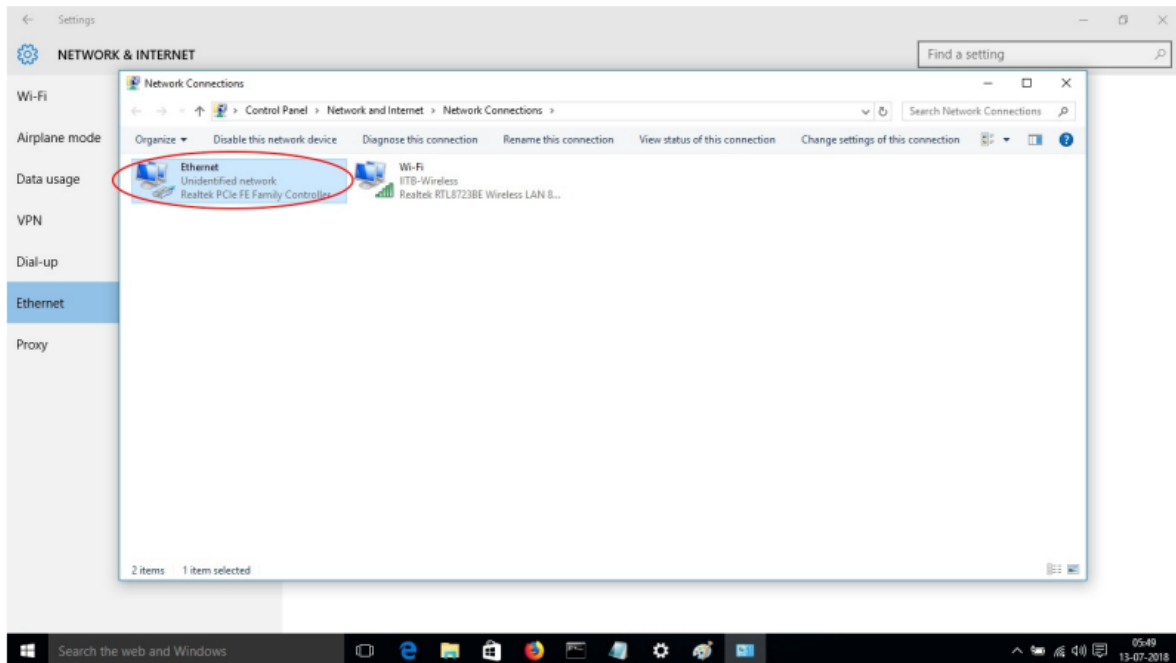

- Open network settings as shown in figure from bottom right corner

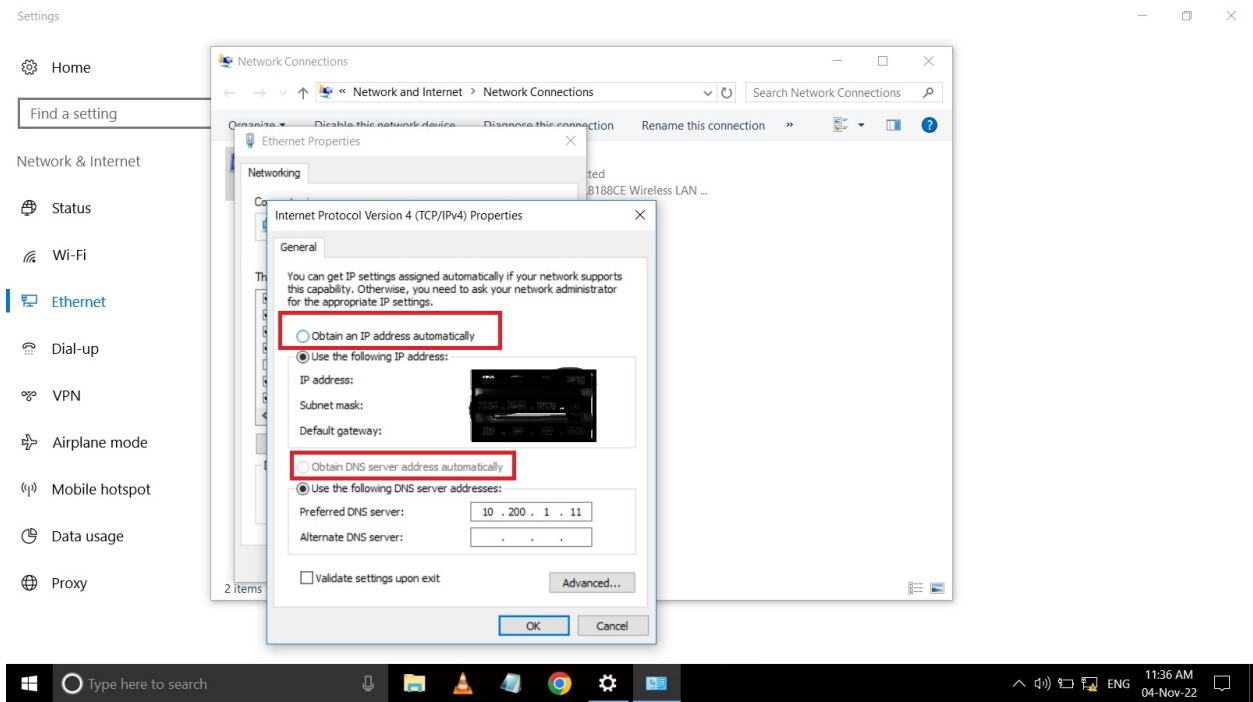

- Select Ethernet settings from left panel and click on "change adapter options"

- Double click on "Ethernet" as shown in figure.

- Click on "Properties".
- Select "Obtain an IP Address Dynamically" and "Obtain DNS server address automatically"

Your network is up now

# Setting the IP(mac)

## Instructions

1. Click on the Apple and select System Preferences
2. Choose Network
3. In the Show drop-down list, make sure that Built-in Ethernet is selected
4. In the TCP/IP tab, delete everything in the boxes, and select Using DHCP from the Configure drop-down list
5. Click Save and close System Preferences
6. Restart your machine to apply the above changes
